

Welcome to the Connecting Climate Minds Hub, where the world of mental health and climate change research unite.

We are dedicated to fostering a connected global research community, all driven by a common goal: **understanding and addressing the intricate relationship between our planet's changing climate and our mental health.**

Prioritizing Global Research and Action for Climate Change and Mental Health

The Global Research and Action Agenda for climate change and mental health sets out priorities for research and action that have been developed from dialogues and consultation with 960+ experts in research, policy, practice, and lived experience in 90 countries.

Your collaborative space for ideas, dialogue, and connection

Whether you want to delve into priority areas for research and action, seek inspiration and understanding from case studies, personal experiences and insights, learn from "how to" toolkits, or are looking to join our growing global community and form new connections, this hub is for you.

Catalysing interdisciplinary research to inform action in policy and practice

[View more](#)

Explore our rich repository of co-created research and action agendas, reports, case studies, lived experience insights and toolkits. All have been designed to support collaboration between disciplines and many different forms of expertise and accelerate and align the growing field of climate change and mental health.

Agendas for populations facing amplified climate mental health impacts

Research and Action Agendas created through dialogues with youth, small farmers and fisher people and Indigenous communities aim to target efforts to understand and respond to the unique insights and vulnerabilities these groups are experiencing in the climate crisis, and the implications for action on mental health and climate change.

[View Agendas](#)

Regional Agendas

The Regional Agendas set out aligned and inclusive priorities for research and action in seven global regions (in line with the Sustainable Development Goal regional groupings), grounded in the needs of those experiencing and responding to climate-related mental health impacts.

Impact Reports

Impact reports outline the demonstrable diversity and impact of activities and collaboration fostered through Connecting Climate Minds to advance research and action on climate change and mental health.

[View Impact Reports](#)

Toolkits

The toolkits are practical guides that help researchers and actors from diverse backgrounds to: 1) come into the climate and mental health field and conduct research appropriately; 2) translate evidence to policy and practice; and 3) meaningfully involve people with lived experience in climate and mental health research.

Case Studies

Case studies showcase existing research, interventions, and policies with implications for the climate-mental health nexus.

Stories of grief, resilience and hope

Understanding and learning from lived experience is essential to navigating the relationship between mental health and climate change. Browse our library of lived experience insights shared by people across the globe, providing invaluable insights into impacts and solutions.

Regional communities driving global research

Our 7 Regional Communities of Practice are at the heart of the Connecting Climate Minds Project, connecting people across countries, disciplines, sectors and experiences. They all bring their unique insights to a thriving community of practice in climate change and mental health research, that is deeply connected to and engages with lived experience needs, and linking out to policy and practice.

Facilitating meaningful connection and collaboration

Whether you're seeking expertise for a project, looking to join forces on research, or wanting to share innovative ideas, our Collaborate area is a meeting place for individuals and organizations from various fields to connect and collaborate.

[About Project](#)

What do we mean by mental health?

Climate change, mental health, and their intersection are complex and wide-ranging fields, understood through a range of diverse perspectives, framings and terminologies.

Mental health challenges (which encompass mental health conditions/illnesses) are defined in Connecting Climate Minds as thoughts, feelings, and behaviours that affect a person's ability to function in one or more areas of life and often involve significant levels of psychological distress.

Ways mental health could be affected by climate change include:

- How climate change may lead to a worsening of pre-existing mental health problems
- How climate change may contribute to the prevalence or impact of existing mental health problems
- How climate change may impact on treatment access or effectiveness for those with mental health problems
- How climate change may lead to new mental health problems.

However, we note that a diversity of perspectives were heard through Connecting Climate Minds, and we have sought to appropriately represent and reflect this in the project outputs.

Who is involved

[View Team](#)

We are a Wellcome funded project that brings together expertise across research, policy, practice, design, and lived experience from across the globe.
